

## DESCRIPTION

The MPM3686 is an easy-to-use fully integrated 20A step-down DC/DC power module. It integrates the DC/DC converter, power inductor, input/output capacitors and the necessary resistors/capacitors in a compact QFN 12mmX15mmX4mm package. This total power solution needs as few as two external components (one resistor and one capacitor) to work. MPM3686 can deliver 20A output current over a wide input supply voltage range with excellent load and line regulation.

The MPM3686 uses Constant-On-Time (COT) control to provide fast transient response and ease the loop stabilization.

The default under voltage lockout threshold is internally set around 4.1V, but a resistor network on the enable pin can increase this threshold. The MPM3686 has an internal LDO to power the control circuits and the integrated power devices. This LDO can be disabled by an external 5V to boost the efficiency.

The MPM3686 has an internal about 3ms soft start (SS) timer. It can be increased with an extra SS capacitor. An open drain power good signal indicates that the output voltage is within nominal voltage range.

The MPM3686 has fully integrated protection features that include over-current protection, over-voltage protection and thermal shutdown.

## FEATURES

- Complete 20A DC-to-DC Solution
- Wide Input Voltage Range from 2.5V:
  - 2.5V to 18V with External 5V Bias
  - 4.5V to 18V with Internal Bias
- 1% Reference Voltage Over 0°C to 70°C Junction Temperature Range
- Adaptive COT Control for Ultrafast Transient Response
- Programmable Switching Frequency from 200KHz to 1MHz
- Support Pre-Bias Start Up
- Programmable Soft-Start Time with Default 3ms
- Non-latch OCP, OVP and Thermal Shutdown
- Output Adjustable from 0.65V to 5V
- QFN-65 (12mmx15mmx4mm) Package

## APPLICATIONS

- Telecom and Networking Systems
- Base Stations
- Servers
- Personal Video Recorders
- Flat Panel Television and Monitors
- Distributed Power Systems

All MPS parts are lead-free, halogen-free, and adhere to the RoHS directive. For MPS green status, please visit the MPS website under Quality Assurance.

12x15x4 QFN .....	2.5.....	14.0 °C/W

**Notes:**

- 1) Exceeding these ratings may damage the device.
- 2) The maximum allowable power dissipation is a function of the maximum junction temperature  $T_J$  (MAX), the junction-to-ambient thermal resistance  $\theta_{JA}$ , and the ambient temperature  $T_A$ . The maximum allowable continuous power dissipation at any ambient temperature is calculated by  $P_D$  (MAX) =  $(T_J$  (MAX)- $T_A$ )/ $\theta_{JA}$ . Exceeding the maximum allowable power dissipation will cause excessive die temperature.
- 3) The device is not guaranteed to function outside of its operating conditions.
- 4) Measured on JESD51-7, 4-layer PCB.
- 5) Need to get some test data from 1<sup>st</sup> sample for calibration and evaluation for MSL Level 2.

## ELECTRICAL CHARACTERISTICS

## PIN FUNCTIONS

Pin #	Name	Description
1, 2, 55, 58, 60	AGND	Analog/Signal Ground. It needs to be connected to GND on PCB layout.
3	>DC_trim	Output Voltage DC Trimming. Connect this pin to pin DC_trim> first, and then to the output voltage sense point through a resistor. The resistor value can be chosen based on equation 1.
4,6,23, 32, 44, 49	N/C	Not connected. Keep these pins floating.
5	AC_trim	Output Voltage AC Trimming. Connect these pins to the output through a capacitor. The capacitor value can be chosen based on equation 2.
7- 22, 61, 62	SW	Switch Output. Keep them floating.
24-31, 63	VOUT	Module voltage output node.
33- 43, 64	GND	System Power Ground. Reference ground of the regulated output voltage. PCB layout requires extra care. Connect using wide PCB traces.
45-48, 65	VIN	Supply Voltage. Supply power to the internal MOSFET and regulator. The MPM3686 operates from a +2.5V to +18V input rail with 5V external bias and from a +4.5V to +18V input rail with internal bias. It requires input decoupling capacitors. Connect using wide PCB traces and multiple vias.
50	>FREQ	Frequency Set In. An internal 430K frequency set resistor is used if connecting this pin to Pin FREQ<. Keep this pin floating if values other than 300K are needed.
51	EN	Enable. Digital input that turns the regulator on or off. Drive EN high to turn on the regulator, drive it low to turn it off. Connect EN to IN through a pull-up resistor or a resistive voltage divider for automatic startup. Do not float this pin.
52	FREQ>	Frequency Set Out. An internal 430K frequency set resistor is used if connecting this pin to Pin FREQ>. If values other than 430K are needed, connect the resistor between this pin and pin VIN.
53	DC_trim>	Output Voltage DC Trimming. Connect this pin to pin >DC_trim first, and then to the output voltage sense point through a resistor. The resistor value can be chosen based on equation 1.
54	SS	Soft Start. Floating this pin has the default 3ms SS time. The SS time can be extended by connecting an external capacitor between SS and AGND pins.
56	PG	Power Good. The output is an open drain signal. Require a pull-up resistor to a DC voltage to indicate high if the output voltage exceeds 91% of the nominal voltage. There is a 2.5ms delay from $FB \geq 91\%$ to PG goes high.
57	VCC	Internal 4.8V LDO Output. Power the driver and control circuits. Keep this pin floating. Applying a 5V external bias can disable the internal LDO to boost the efficiency.
59	BST	Bootstrap. Keep this pin floating.

### BLOCK DIAGRAM

## OPERATION

### Power Module Operation

The MPM3686 is a high performance single output synchronous switching mode DC-to-DC power supply. It can deliver 20A continuous output current. The MPM3686 can provide an output voltage from 0.65V to 5V over a 4.5V to 18V (or 2.5V to 18V with 5V external VCC bias) wide input voltage range.

The MPM3686 is a complete power solution. It integrates a constant-on-time (COT) control DC-to-DC regulator, power devices, an inductor, input/output capacitors and some other supporting resistors and small capacitors. It only needs as few as one external resistor and one external small capacitor to operate.

The MPM3686 is controlled by both the VCC voltage and the EN signal. It can only be turned on when both voltages are higher than the thresholds.

The switching frequency is determined by a frequency set resistor. The default switching frequency with the integrated resistor is shown in table 1. The default switching frequency increases with the output voltage. The switching frequency can also be programmed externally in the range of 200KHz to 1000KHz. The details can be found in the section of “SWITCHING FREQUENCY SETTING” on Page 12.

The MPM3686 utilizes constant-on-time control. It has sufficient stability margin with simple loop compensation. And it provides very good transient response with a wide range of output capacitors, even with all ceramic output capacitors.

The MPM3686 has a variable soft start timer to smooth-out the output voltage during start-up. The default (with SS pin floating) soft start timer is about 3ms. The soft-start time can be extended by adding a capacitor between SS pin and AGND pin.

### PWM Operation

The MPM3686 uses Constant-on-time (COT) control to provide a fast transient response and ease loop stabilization.

At the beginning of each cycle, the high-side MOSFET (HS-FET) turns ON when the feedback voltage ( $V_{FB}$ ) drops below the reference voltage ( $V_{REF}$ ), which indicates an insufficient output voltage. The input voltage and the frequency-set resistor determine the ON period as follows:

$$T_{ON}(ns) = \frac{6.1 \times R_{FREQ}(k\Omega)}{V_{IN}(V) - 0.4} \quad (1)$$

After the ON period elapses, the HS-FET turns off. It turns ON again when  $V_{FB}$  drops below  $V_{REF}$ . By repeating this operation, the converter regulates the output voltage to the desired level. The integrated low-side MOSFET (LS-FET) turns on when the HS-FET is OFF to minimize the conduction loss. There is a dead short (or shoot-through) between input and GND if both HS-FET and LS-FET turn on at the same time. A dead-time (DT) internally generated between HS-FET OFF and LS-FET ON, or LS-FET OFF and HS-FET ON avoids shoot-through.

### Heavy-Load Operation

**Figure 2—Heavy Load Operation**

When the output current is high and the inductor current is always above zero amps, it is called continuous-conduction-mode (CCM). Figure 2 shows the CCM operation. When  $V_{FB}$  is below  $V_{REF}$ , HS-FET turns on for a fixed interval determined by the one-shot on-timer as per equation 1. When the HS-FET turns off, the LS-FET turns on until the next period.

In CCM operation, the switching frequency is fairly constant and is also called PWM mode.

### Light-Load Operation

As the load decreases, the inductor current decreases too. When the inductor current touches zero, the operation is transitioned from continuous-conduction-mode (CCM) to discontinuous-conduction-mode (DCM).

Figure 3 shows the light load operation. When  $V_{FB}$  drops below  $V_{REF}$ , HS-FET turns on for a fixed interval determined by the one-shot timer as per equation 1. When the HS-FET turns off, the LS-FET turns on until the inductor current reaches zero. In DCM operation, the  $V_{FB}$  does not reach  $V_{REF}$  when the inductor current is approaching zero. The LS-FET driver turns into tri-state (high Z) whenever the inductor current reaches zero. A current modulator takes over the control of LS-FET and limits the inductor current less than  $-1\text{mA}$ . Hence, the output capacitors discharge slowly to GND through LS-FET. As a result, this mode improves the efficiency greatly at light load condition. At this condition, the HS-FET does not turn ON as frequently as at heavy load condition. This is called pulse skip mode.

At light load or no load condition, the output drops very slowly and the MPM3686 reduces the switching frequency naturally and then achieves high efficiency at light load.

**Figure 3—Light Load Operation**

As the output current increases from the light load condition, the current modulator regulates the operating period that becomes shorter. The HS-FET turns ON more frequently. Hence, the switching frequency increases correspondingly. The output current reaches the critical level when the current modulator time decreases to zero. The critical output current level can be determined as follows:

$$I_{OUT} = \frac{(V_{IN} - V_{OUT}) \times V_{OUT}}{2 \times L \times F_{SW} \times V_{IN}} \quad (2)$$

Where  $F_{SW}$  is the switching frequency.

The IC turns into PWM mode once the output current exceeds the critical level. After that, the switching frequency stays fairly constant over the output current range.

### Switching Frequency

Selecting the switching frequency requires trading off between efficiency and component size. Low frequency operation increases efficiency by reducing MOSFET switching losses, but requires larger inductor and capacitor values to minimize the output voltage ripple.

The MPM3686 uses adaptive constant-on-time (COT) control to generate a fairly constant frequency at CCM condition, though the IC lacks a dedicated oscillator. The ON time of HSFET can be set by connecting a resistor between IN pin and FREQ pin. It's input voltage adaptive. So for a fixed output voltage, the switching frequency stays fairly constant. The switching frequency can be set internally and externally.

Figure 4 shows that the switching frequency is determined by the internal 430K resistor. The 430K resistor is connected to IN pin so that the input voltage is feed-forwarded to the one-shot ON-time timer. When operating in steady state at CCM, the duty ratio stays at  $V_{OUT}/V_{IN}$ , so the switching frequency is fairly constant over the input voltage range. The switching frequency can be determined by equation 3:

**Figure 4**

$$F_{SW} \text{ (kHz)} = \frac{10^6}{6.1 \times 430 \text{ (k}\Omega) \times \frac{V_{IN} \text{ (V)}}{V_{OUT} \text{ (V)}} + T_{DELAY} \text{ (ns)}} \quad (3)$$

Where  $T_{DELAY}$  is the comparator delay of about 5ns.

Table 1 shows the switching frequency with different common output voltages:

V <sub>o</sub> (V)	f <sub>s</sub> (KHz)
1	400
1.2	500
1.5	600
1.8	700

**Table 1**

If a switching frequency other than those listed in Table 1 is desired, an external frequency set resistor can be connected as shown in figure 5:

**Figure 5**

The switching frequency can be estimated through equation (4) as follows:

$$F_{sw}(\text{kHz}) = \frac{10^6}{\frac{6.1 \times R_{FREQ}(\text{k}\Omega)}{V_{IN}(\text{V}) - 0.4} \times \frac{V_{IN}(\text{V})}{V_{OUT}(\text{V})} + T_{DELAY}(\text{ns})} \quad (4)$$

Where  $T_{DELAY}$  is the comparator delay of about 5ns.

Typically, the MPM3686 is set to 200kHz to 1MHz applications. Thanks to its monolithic structure, the MPM3686 is optimized to operate at high switching frequencies at high efficiency. High switching frequencies allow for physically smaller LC filter components to reduce the PCB footprint.

### Configuring the EN Control

The power module turns on when EN goes high; conversely it turns off when EN goes low. Do not float the pin.

For automatic start-up, pull the EN pin up to input voltage through a resistive voltage divider. Choose the values of the pull-up resistor ( $R_{UP}$  from the IN pin to the EN pin) and the pull-down resistor ( $R_{DOWN}$  from the EN pin to GND) to

determine the automatic start-up voltage:

$$V_{IN-START} = 1.5 \times \frac{(R_{UP} + R_{DOWN})}{R_{DOWN}} (V) \quad (5)$$

For example, for  $R_{UP}=100\text{k}\Omega$  and  $R_{DOWN}=51\text{k}\Omega$ , the  $V_{IN-START}$  is set at 4.44V.

To reduce noise, add a 10nF ceramic capacitor from EN to GND.

An internal zener diode on the EN pin clamps the EN pin voltage to prevent running away. The maximum pull up current (assuming the worst case 6V for the internal zener clamp) should be limited to 1mA or less.

Therefore, when driving EN with an external logic signal, the driving voltage should be less than 6V. When connecting EN to IN through a pull-up resistor or a resistive voltage divider, select a resistance that ensures a maximum pull-up current of 1mA.

If using a resistive voltage divider and  $V_{IN}$  exceeds 6V, then the minimum resistance for the pull-up resistor  $R_{UP}$  should meet:

$$\frac{V_{IN} - 6V}{R_{UP}} - \frac{6V}{R_{DOWN}} \leq 1\text{mA} \quad (6)$$

With only  $R_{UP}$  (the pull-down resistor,  $R_{DOWN}$ , is not connected), then the VCC UVLO threshold determines  $V_{IN-START}$ , so the minimum resistor value is:

$$R_{UP} \geq \frac{V_{IN} - 6V}{1\text{mA}} (\Omega) \quad (7)$$

A typical pull-up resistor is 100kΩ.

### VCC Power Supply

The MPM3686 has an internal VCC LDO to supply the power to the internal circuits and drives the power devices. This VCC LDO is derived from the input supply. To ensure proper operation, the minimum input voltage should be 4.5V.

An external 5V VCC bias can disable the internal LDO. In this case,  $V_{in}$  can be as low as 2.5V. The efficiency can be higher with external 5V VCC bias. Figure 6 shows the comparison.

**Figure 6**

### Soft Start

The MPM3686 employs a soft start (SS) mechanism to ensure a smooth output during power-up. When the EN pin goes high, an internal current source (20µA) charges the SS capacitor. The SS capacitor voltage takes over the REF voltage to the PWM comparator. The output voltage smoothly ramps up with the SS voltage. Once the SS voltage reaches the REF voltage, it continues ramping up while  $V_{REF}$  takes over the PWM comparator. At this point, soft start finishes and the device enters steady state operation.

An internal 100nF SS capacitor is used. So the default (with SS pin floating) SS time can be estimated as:

$$T_{SS}(\text{ms}) = \frac{100(\text{nF}) \times V_{REF}(\text{V})}{I_{SS}(\mu\text{A})} \quad (8)$$

So the default SS time is about 3ms.

If longer SS time is needed, an external SS capacitor can be added between SS pin and AGND pin. The external capacitor value can be determined as follows:

$$C_{SS}(\text{nF}) = \frac{T_{SS}(\text{ms}) \times I_{SS}(\mu\text{A})}{V_{REF}(\text{V})} - 100(\text{nF}) \quad (9)$$

### Pre-Bias Startup

The MPM3686 has been designed for monotonic startup into pre-biased loads. If the output is pre-biased to a certain voltage during startup, the IC will disable switching for both high-side and low-side switches until the voltage

on the soft-start capacitor exceeds the sensed output voltage at the FB pin.

### Power Good (PG)

The MPM3686 has a power-good (PG) output. The PG pin is the open drain of a MOSFET. Connect it to VCC or some other voltage source that measures less than 5.5V through a pull-up resistor (typically 100kΩ). After applying the input voltage, the MOSFET turns on so that the PG pin is pulled to GND before the SS is ready. After the FB voltage reaches 91% of the REF voltage, the PG pin is pulled high after a 2.5ms delay.

When the FB voltage drops to 80% of the REF voltage or exceeds 120% of the nominal REF voltage, the PG pin is pulled low.

If the input supply fails to power the MPM3686, the PG pin is also pulled low even though this pin is tied to an external DC source through a pull-up resistor.

### Over-Current Protection (OCP)

The MPM3686 features two current limit levels for over-current conditions: low-side valley current limit and low-side negative current limit.

*Low-Side Valley Current Limit.* The device monitors the inductor current during the LS-FET ON state. If the LS-FET sourcing current is higher than the internal positive-valley-current limit, the HS-FET remains OFF and the LS-FET remains ON for the next ON time. When the LS-FET sourcing current drops below the valley current limit, then the LS-FET turns off and the HS-FET turns on again.

The MPM3686 enters OCP non-latch protection mode if the LS-FET sourcing valley current keeps exceeding the valley current limit for a certain period of time. During OCP, the device tries to recover from the over-current fault with hiccup mode: the chip disables the output power stage, discharges the soft-start capacitor and then automatically retries soft-start. The device repeats this operation cycle as long as the over-current condition still exists. When the over-current condition disappears, the MPM3686 initiates a new SS to rise back to regulation level.

**Low-Side Negative Current Limit:** If the sensed LS-FET negative current exceeds the negative current limit, the LS-FET turns off immediately and stays OFF for the remainder of the OFF period. In this situation, both MOSFETs are OFF until the end of a fixed interval. The HS-FET body diode conducts the inductor current for the fixed time.

### Over -Voltage Protection (OVP)

The MPM3686 monitors the output voltage using the FB pin connected to the tap of a resistor divider to detect over-voltage. It provides non-latch OVP mode.

If the FB voltage exceeds the nominal REF voltage but remains lower than 120% of the REF voltage (0.611V), both MOSFETs are off.

If the FB voltage exceeds 120% of the REF voltage but remains below 130%, the LS-FET turns on while the HS-FET remains off. The LS-FET remains on until the FB voltage drops below 110% of the REF voltage or the low-side negative current limit is hit.

If the FB voltage exceeds 130% of the REF voltage, it enters a non-latch mode. The LS-FET remains on until the FB voltage drops below 110% of the REF voltage, and the MPM3686 initiates a new SS to rise back to regulation level and operates normally again.

### UVLO protection

The MPM3686 has under-voltage lock-out protection (UVLO). When the VCC voltage exceeds the UVLO rising threshold, the MPM3686 powers up. It shuts off when the VCC voltage falls below the UVLO falling threshold voltage. This is non-latch protection. The MPM3686 is disabled when the VCC voltage falls below 3.3 V. If an application requires a higher UVLO threshold, use the two external resistors connected to the EN pin as shown in Figure 9 to adjust the startup input voltage. For best results, use the enable resistors to set the input voltage falling threshold ( $V_{STOP}$ ) above 3.6 V. Set the rising threshold ( $V_{START}$ ) to provide enough hysteresis to account for any input supply variations.

Figure 7—Adjustable UVLO Threshold

### Thermal Shutdown

The MPM3686 has thermal shutdown. The IC internally monitors the junction temperature. If the junction temperature exceeds the threshold value (minimum 150°C), the converter shuts off. This is a non-latch protection. There is about 25°C hysteresis. Once the junction temperature drops to about 125°C, it initiates a soft startup.

## APPLICATION INFORMATION

### Setting the Output Voltage-Small ESR Capacitors

When the output capacitors are all ceramic capacitors or capacitors with small ESR, external RAMP is injected through the R/C network across the inductor. The circuit connection is as follows:

**Figure 8**

Here is the procedure to find the values for Ctrim and Rtrim:

a) Determine the Ton

$$T_{ON}(ns) = \frac{5.3 \times R_{FREQ}(K\Omega)}{V_{IN}(V) - 0.4} \quad (10)$$

b) Determine Ctrim. Choose a VRAMP around 10mV-30mV for most of the applications.

$$C_{TRIM}(pF) = \frac{V_{IN}(V) - V_{OUT}(V)}{R_3(K\Omega) \times V_{RAMP}(V)} \times T_{ON}(ns) \quad (11)$$

c) Find the average feedback voltage VFB

$$V_{FB\_AVG}(V) = V_{REF}(V) + \frac{V_{RAMP}(V)}{2} \quad (12)$$

d) Calculate Rtrim to get the desired output voltage:

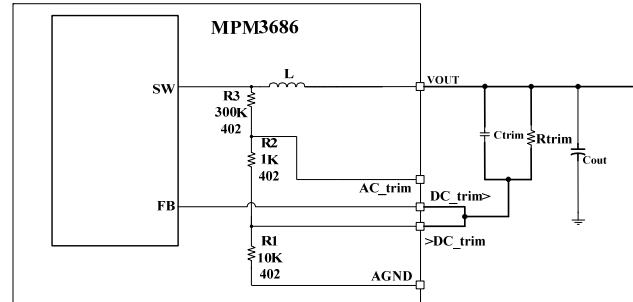

$$R_o(K\Omega) = \left( \frac{V_{OUT}(V)}{V_{FB\_AVG}(V)} - 1 \right) \times 10(K\Omega) \quad (13)$$

$$R_{TRIM}(K\Omega) = \frac{R_o(K\Omega) \times 300(K\Omega)}{300(K\Omega) - R_o(K\Omega)} \quad (14)$$

### Setting the Output Voltage-Large ESR Capacitors

If one or more piece of the output capacitors have large ESR, then there is no need of external RAMP. Otherwise, it'll generate group pulses at

light load conditions. The Ctrim is still recommended to boost the phase margin of the system. A value between 100pF and 2.2nF is recommended. The circuit connection can be made as the following:

**Figure 9**

The Rtrim can be determined as follows to obtain the desired output voltage:

$$R_{TRIM}(K\Omega) = \frac{V_{OUT} - V_{REF}}{V_{REF}} \times 10 \quad (15)$$

### Input Capacitor

The input current to the step-down power module is discontinuous, and therefore, it requires a capacitor to supply the AC current to the step-down power module while maintaining the DC input voltage. Use ceramic capacitors for best performance. During layout, Place the input capacitors as close to the IN and GND pins as possible.

The capacitance can vary significantly with temperature. Use capacitors with X5R or X7R ceramic dielectrics because they are fairly stable over a wide temperature range.

The capacitors must also have a ripple current rating that exceeds the converter's maximum input ripple current. Estimate the input ripple current as follows:

$$I_{CIN} = I_{OUT} \times \sqrt{\frac{V_{OUT}}{V_{IN}} \times \left( 1 - \frac{V_{OUT}}{V_{IN}} \right)} \quad (16)$$

The worst-case condition occurs at  $V_{IN} = 2V_{OUT}$ , where:

$$I_{CIN} = \frac{I_{OUT}}{2} \quad (17)$$

For simplification, choose an input capacitor with an RMS current rating that exceeds half the maximum load current.

The input capacitance value determines the converter input voltage ripple. Select a capacitor value that meets any input voltage ripple requirements.

Estimate the input voltage ripple as follows:

$$\Delta V_{IN} = \frac{I_{OUT}}{F_{SW} \times C_{IN}} \times \frac{V_{OUT}}{V_{IN}} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right) \quad (18)$$

The worst-case condition occurs at  $V_{IN} = 2V_{OUT}$ , where:

$$\Delta V_{IN} = \frac{1}{4} \times \frac{I_{OUT}}{F_{SW} \times C_{IN}} \quad (19)$$

### PCB Layout Recommendations

1. Place the input/output capacitors on the same side of the MPM3686, and as close to the MPM3686 package as possible.
2. A solid system ground layer is required to be placed immediately below the surface layer with the MPM3686.
3. Thermal VIAs (18 mil diameter and 8 mil hole size) are required to be placed underneath the GND, IN and VOUT pads, as well as the edges of the MPM3686 and the input/output capacitors.
4. Keep the DC\_trim traces as short as possible.

**Typical Design Parameter Table**

The following table (Table 2) includes the recommended component values for typical designs.

Ref	Vin (V)	Vout (V)	Rtrim (K $\Omega$ )	Ctrim (pF)	Rfreq (K $\Omega$ )	fs (KHz)	Cout ( $\mu$ F)	Ripple (mV)
1	12	1	6.49	560	NS	400	5X47	11.6
2	12	1	6.49	560	NS	400	3X47	16.4
3	12	1	6.49	560	300	600	5X47	5.0
4	12	1	6.49	560	300	600	3X47	7.6
5	12	1	6.49	220	178	1000	3X47	3.8
6	12	1	6.49	330	178	1000	5X47	2.2
7	12	1.2	10	560	649	300	5X47	24.0
8	12	1.2	10	560	649	300	3X47	38.4
9	12	1.2	10	560	NS	500	5X47	11.2
10	12	1.2	10	560	NS	500	3X47	14.8
11	12	1.2	10	270	200	1000	5X47	3.2
12	12	1.2	10	270	200	1000	3X47	4.6
13	12	1.5	15	680	806	300	5X47	32.8
14	12	1.5	15	680	806	300	3X47	46.0
15	12	1.5	15	560	NS	600	5X47	8.4
16	12	1.5	15	560	NS	600	3X47	11.6
17	12	1.5	15.8	330	243	1000	5X47	5.8
18	12	1.5	15.8	330	243	1000	3X47	7.0
19	12	1.8	21	560	750	400	5X47	25.4
20	12	1.8	21	560	750	400	3X47	49.6
21	12	1.8	21	560	NS	750	5X47	7.6
22	12	1.8	21	560	NS	750	3X47	9.4
23	12	1.8	21	470	301	1000	5X47	8.8
24	12	1.8	21	330	301	1000	3X47	12.4
25	12	2.5	34	680	1000	400	5X47	34.2
26	12	2.5	34	680	1000	400	3X47	46.4
27	12	2.5	35.7	680	715	600	5X47	18.8
28	12	2.5	35.7	680	715	600	3X47	25.2
29	12	2.5	34	330	432	1000	5X47	9.8
30	12	2.5	34	270	432	1000	3X47	13.0
33	12	3.3	49.9	330	1000	600	5X47	31.6
34	12	3.3	49.9	330	1000	600	7X47	21.2
35	12	3.3	49.9	270	549	1000	5X47	6.0
36	12	3.3	49.9	270	549	1000	3X47	10.2
39	12	5	90.9	390	1500	600	5X47	49.2
40	12	5	90.9	390	1500	600	7X47	36.0
41	12	5	90.9	180	909	1000	5X47	20.8
42	12	5	90.9	150	909	1000	3X47	28.8

# PACKAGE INFORMATION

## QFN-65 (12mmx15mmx4mm)

**TOP VIEW**

**BOTTOM VIEW**

**SIDE VIEW**

**RECOMMENDED LAND PATTERN**

**NOTE:**

- 1) ALL DIMENSIONS ARE IN MILLIMETERS.
- 2) SHADED AREA IS THE KEEP OUT ZONE THAT THE EXPOSED NON-CONNECTING PACKAGE METAL PAD ENCLOSED BY THE ZONE IS NOT TO BE CONNECTED.
- 3) EXPOSED PADDLE SIZE DOES NOT INCLUDE MOLD FLASH.
- 4) LEAD COPLANARITY SHALL BE 0.10 MILLIMETERS MAX.
- 5) JEDEC REFERENCE IS MO-220.
- 6) DRAWING IS NOT TO SCALE.
