

## SLLIMM™ - 2<sup>nd</sup> series IPM, 3-phase inverter, 35 A, 600 V short-circuit rugged IGBT

### Features

- IPM 35 A, 600 V 3-phase IGBT inverter bridge including 2 control ICs for gate driving and freewheeling diodes
- 3.3 V, 5 V TTL/CMOS inputs with hysteresis
- Internal bootstrap diode
- Under-voltage lockout of gate drivers
- Smart shutdown function
- Short-circuit protection
- Shutdown input/fault output
- Separate open emitter outputs
- Built-in temperature sensor
- Comparator for fault protection
- Short-circuit rugged TFS IGBTs
- Very fast, soft recovery diodes
- 85 kΩ NTC UL 1434 CA 4 recognized
- Fully isolated package
- Isolation rating of 1500 Vrms/min
- UL recognition: UL 1557, file E81734

### Applications

- 3-phase inverters for motor drives
- Home appliances such as washing machines, refrigerators, air conditioners and sewing machines

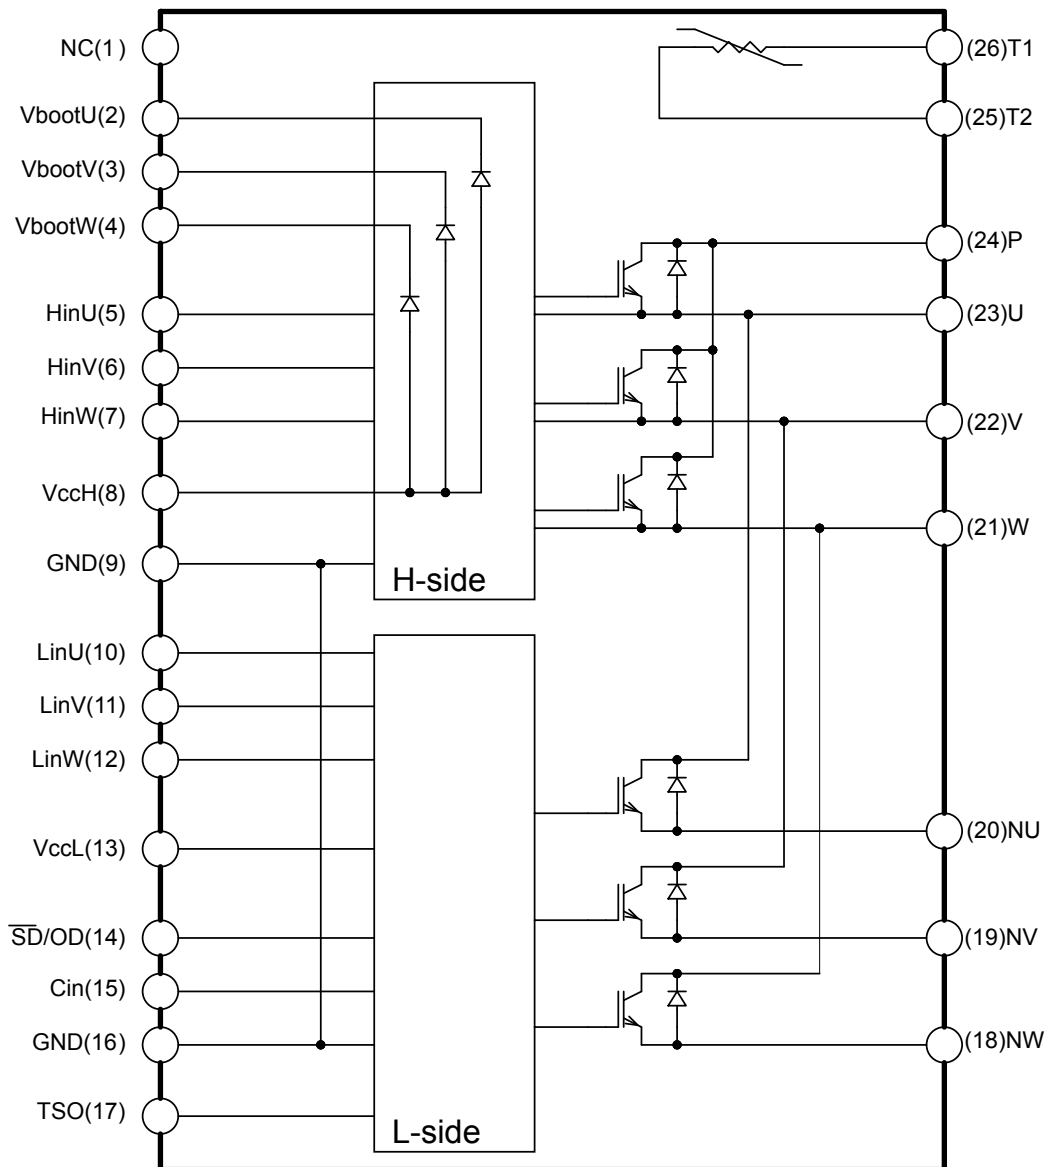

### Description

This second series of SLLIMM (small low-loss intelligent molded module) provides a compact, high-performance AC motor drive in a simple, rugged design. It combines new ST proprietary control ICs (one LS and one HS driver) with an improved short-circuit rugged trench gate field-stop (TFS) IGBT, making it ideal for motor drives operating up to 20 kHz in hard-switching circuitries. SLLIMM™ is a trademark of STMicroelectronics.

**Table 1. Pin description**

| Pin | Symbol               | Description  |
|-----|----------------------|--|
| 1   | NC                   | -  |
| 2   | VBOOTu               | Bootstrap voltage for U phase                                      |
| 3   | VBOOTv               | Bootstrap voltage for V phase                                      |
| 4   | VBOOTw               | Bootstrap voltage for W phase                                      |
| 5   | HINu                 | High-side logic input for U phase                                  |
| 6   | HINv                 | High-side logic input for V phase                                  |
| 7   | HINw                 | High-side logic input for W phase                                  |
| 8   | VCCH                 | High-side low voltage power supply                                 |
| 9   | GND                  | Ground   |
| 10  | LINu                 | Low-side logic input for U phase                                   |
| 11  | LINv                 | Low-side logic input for V phase                                   |
| 12  | LINw                 | Low-side logic input for W phase                                   |
| 13  | VCCL                 | Low-side low voltage power supply                                  |
| 14  | $\overline{SD}$ / OD | Shutdown logic input (active low) / open-drain (comparator output) |
| 15  | CIN                  | Comparator input   |
| 16  | GND                  | Ground   |
| 17  | TSO                  | Temperature sensor output  |
| 18  | NW                   | Negative DC input for W phase                                      |
| 19  | NV                   | Negative DC input for V phase                                      |
| 20  | NU                   | Negative DC input for U phase                                      |
| 21  | W                    | W phase output   |
| 22  | V                    | V phase output   |
| 23  | U                    | U phase output   |
| 24  | P                    | Positive DC input  |
| 25  | T2                   | NTC thermistor terminal 2  |
| 26  | T1                   | NTC thermistor terminal 1  |

## 2 Absolute maximum ratings

$T_J = 25\text{ °C}$  unless otherwise noted.

**Table 2. Inverter parts**

| Symbol          | Parameter  | Value | Unit          |
|-----------------|--|-------|---------------|
| $V_{PN}$        | Supply voltage among P -N <sub>U</sub> , -N <sub>V</sub> , -N <sub>W</sub>   | 450   | V             |
| $V_{PN(surge)}$ | Supply voltage surge among P -N <sub>U</sub> , -N <sub>V</sub> , -N <sub>W</sub>   | 500   | V             |
| $V_{CES}$       | Collector-emitter voltage each IGBT  | 600   | V             |
| $\pm I_C$       | Continuous collector current each IGBT ( $T_C = 25\text{ °C}$ )  | 35    | A             |
|                 | Continuous collector current each IGBT ( $T_C = 80\text{ °C}$ )  | 30    |               |
| $\pm I_{CP}$    | Peak collector current each IGBT (less than 1 ms)  | 70    | A             |
| $P_{TOT}$       | Total dissipation at $T_C=25\text{ °C}$ each IGBT  | 125   | W             |
| $t_{scw}$       | Short circuit withstand time, $V_{CE} = 300\text{ V}$ , $T_J = 125\text{ °C}$ ,<br>$V_{CC} = V_{boot} = 15\text{ V}$ , $V_{IN} = 0\text{ to }5\text{ V}$ | 8     | $\mu\text{s}$ |

**Table 3. Control parts**

| Symbol                 | Parameter   | Min.            | Max.             | Unit |
|------------------------|---|-----------------|------------------|------|
| $V_{CC}$               | Supply voltage between $V_{CCH-GND}$ , $V_{CCL-GND}$                          | -0.3            | 20               | V    |
| $V_{BOOT}$             | Bootstrap voltage   | -0.3            | 619              | V    |
| $V_{OUT}$              | Output voltage among U, V, W and GND  | $V_{BOOT} - 21$ | $V_{BOOT} + 0.3$ | V    |
| $V_{CIN}$              | Comparator input voltage  | -0.3            | 20               | V    |
| $V_{IN}$               | Logic input voltage applied among HIN <sub>x</sub> , LIN <sub>x</sub> and GND | -0.3            | 15               | V    |
| $\overline{V}_{SD/OD}$ | Open-drain voltage  | -0.3            | 7                | V    |
| $\overline{I}_{SD/OD}$ | Open-drain sink current   | -               | 10               | mA   |
| $V_{TSO}$              | Temperature sensor output voltage   | -0.3            | 5.5              | V    |
| $I_{TSO}$              | Temperature sensor output current   |                 | 7                | mA   |

**Table 4. Total system**

| Symbol    | Parameter  | Value      | Unit             |
|-----------|--|------------|------------------|
| $V_{ISO}$ | Isolation withstand voltage applied between each pin and heat sink plate<br>(AC voltage, $t = 60\text{ s}$ ) | 1500       | V <sub>rms</sub> |
| $T_J$     | Power chips operating junction temperature   | -40 to 175 | °C               |
| $T_C$     | Module case operation temperature  | -40 to 125 | °C               |

## 2.1 Thermal data

**Table 5. Thermal data**

| Symbol        | Parameter                                     | Value | Unit |
|---------------|---|-------|------|
| $R_{th(j-c)}$ | Thermal resistance junction-case single IGBT  | 1.2   | °C/W |
|               | Thermal resistance junction-case single diode | 2.3   |      |

### 3 Electrical characteristics

$T_J = 25\text{ °C}$  unless otherwise noted.

#### 3.1 Inverter part

| $t_{CIN\_SD}$ | $C_{IN}$ comparator delay to $\overline{SD}$ | $\overline{SD}$ pulled to 5 V through $R_{SD} = 10\text{ k}\Omega$ ;<br>measured applying a voltage step 0-1 V to pin CIN;<br>50 % CIN to 90 % $\overline{SD}$                  | 240  | 320  | 410  | ns                     |
| $SR_{SD}$     | $\overline{SD}$ fall slew rate               | $\overline{SD}$ pulled to 5 V through $R_{SD} = 10\text{ k}\Omega$ ;<br>$C_L = 1\text{ nF}$ through $\overline{SD}$ and ground;<br>90 % $\overline{SD}$ to 10 % $\overline{SD}$ |      | 25   |      | $\text{V}/\mu\text{s}$ |

The comparator stays enabled even if  $V_{CC}$  is in the UVLO condition but higher than 4 V.

## 4 Fault management

The device integrates an open-drain output connected to the  $\overline{SD}$  pin. As soon as a fault occurs, the open-drain is activated and the LVGx outputs are forced low. Two types of fault can be identified:

- Overcurrent (OC) sensed by the internal comparator (see more detail in [Section 4.1 Smart shutdown function](#));
- Undervoltage on supply voltage ( $V_{CC}$ )

Each fault enables the SD open drain for a different time, as described in the following table.

**Table 11. Fault timing**

| Symbol | Parameter                   | Event time <sup>(1)</sup>  | SD open-drain enable time result <sup>(1)(2)</sup> |
|--------|-----------------------------|--|--|
| OC     | Over-current event          | $\leq 24 \mu\text{s}$  | 24 $\mu\text{s}$                                   |
|        |                             | $> 24 \mu\text{s}$   | OC time  |
| UVLO   | Under-voltage lockout event | $\leq 70 \mu\text{s}$  | 70 $\mu\text{s}$                                   |
|        |                             | $> 70 \mu\text{s}$<br>until the $V_{CC\_LS}$ exceeds the $V_{CC\_LS}$ UV turn ON threshold | UVLO time  |

1. Typical value ( $-40 \text{ }^\circ\text{C} \leq T_J \leq +125 \text{ }^\circ\text{C}$ )

2. Without contribution of the RC network on SD

Actually, the device remains in a fault condition ( $\overline{SD}$  at low logic level and LVGx outputs disabled) for a time also depending on the RC network connected to the  $\overline{SD}$  pin. The network generates a time contribution that is added to the internal value.

**Figure 4. Overcurrent timing (without contribution of the RC network on  $\overline{SD}$ )**

GIPG120520141638FSR

**Figure 5. UVLO timing (without contribution of the RC network on  $\overline{SD}$ )**

GIPG120520141644FSR

## 4.1 Smart shutdown function

The device integrates a comparator committed to the fault sensing function. The comparator input can be connected to an external shunt resistor in order to implement a simple overcurrent detection function.

The output signal of the comparator is fed to an integrated MOSFET with the open drain output available on the SD input. When the comparator triggers, the device is set in shutdown state and its outputs are all set to low level.

**Figure 6. Smart shutdown timing waveforms in case of overcurrent event**

$R_{ON\_OD} = V_{OD}/5 \text{ mA}$ , see Table 10. Sense comparator ( $V_{CC} = 15 \text{ V}$ , unless otherwise is specified);

$R_{PD\_SD} (\text{typ.}) = 5 \text{ V}/I_{SDh}$

In common overcurrent protection designs, the comparator output is usually connected to the  $\overline{SD}$  input and an RC network is connected to this  $\overline{SD}$  line in order to provide a mono-stable circuit which implements a protection time that follows the fault condition.

As opposed to common fault detection systems, the device smart shutdown architecture allows the immediate turn-off of output gates driver in case of fault, by minimizing the propagation delay between the fault detection event and the actual switching off of the outputs. In fact, the time delay between the fault and the turning off of the outputs is no longer dependent on the RC value of the external network connected to the pin.

In the smart shutdown circuitry, the fault signal has a preferential path which directly switches off the outputs after the comparator triggering.

At the same time, the internal logic turns on the open-drain output and holds it on until the  $\overline{SD}$  voltage goes below the  $V_{SSD}$  threshold and the  $t_{oc}$  time is elapsed.

The driver outputs restart following the input pins as soon as the voltage at the  $\overline{SD}$  pin reaches the higher threshold of the  $\overline{SD}$  logic input.

The smart shutdown system provides the possibility to increase the time constant of the external RC network (i.e., the disable time after the fault event) up to very high values without increasing the delay time of the protection.

## 5 Temperature monitoring solutions

### 5.1 TSO output

The device integrates a temperature sensor. A voltage proportional to the die temperature is available on the TSO pin. When this function is not used, the pin can be left floating.

Figure 7.  $V_{TSO}$  output characteristics vs LVIC temperature

### 5.2 NTC thermistor

Table 12. NTC thermistor

| Symbol    | Parameter                   | Test condition                   | Min. | Typ. | Max. | Unit               |

## 6 Application circuit example

Figure 10. Application circuit example

Application designers are free to use a different scheme according to the device specifications.

## 6.1 Guidelines

1. Input signals HIN, LIN are active-high logic. A 100 k $\Omega$  (typ.) pull-down resistor is built-in for each input pin. To prevent input signal oscillations, the wiring of each input should be as short as possible and the use of RC filters ( $R_1$ ,  $C_1$ ) on each input signal is suggested. The filters should be with a time constant of about 100 ns and placed as close as possible to the IPM input pins.
2. The use of a bypass capacitor  $C_{VCC}$  (aluminum or tantalum) reduces the transient circuit demand on the power supply. Besides, to reduce any high-frequency switching noise distributed on the power lines, a  $C_2$  decoupling capacitor (100 to 220 nF, with low ESR and low ESL) should be placed as close as possible to each  $V_{CC}$  pin and in parallel with the bypass capacitor.
3. The use of an RC filter ( $R_{SF}$ ,  $C_{SF}$ ) is recommended to avoid protection circuit malfunctions. The time constant ( $R_{SF} \times C_{SF}$ ) should be set to 1  $\mu$ s and the filter must be placed as close as possible to the CIN pin.
4. The  $\overline{SD}$  is an input/output pin (open-drain type if it is used as output). It has to be pulled up to a power supply (i.e., MCU bias at 3.3/5 V) by a resistor value, which can keep the  $I_{od}$  no higher than 5 mA ( $V_{OD} \leq 500$  mV when open-drain MOSFET is ON). The filter on  $\overline{SD}$  should be sized to get a desired re-starting time after a fault event and placed as close as possible to the  $\overline{SD}$  pin.
5. A decoupling capacitor  $C_{TSO}$  between 1 nF and 10 nF can be used to increase the noise immunity of the TSO thermal sensor; a similar decoupling capacitor  $C_{OT}$  (between 10 nF and 100 nF) can be implemented if the NTC thermistor is available and used. In both cases, their effectiveness is improved if these capacitors are placed close to the MCU.
6. The  $C_3$  decoupling capacitor (100 to 220 nF with low ESR and low ESL) in parallel with each  $C_{boot}$  is useful to filter high-frequency disturbances. Both  $C_{boot}$  and  $C_3$  (if present) should be placed as close as possible to the U,V,W and  $V_{boot}$  pins. Bootstrap negative electrodes should be connected to the U,V,W terminals directly and separated from the main output wires.
7. To prevent overvoltage on the  $V_{CC}$  pin, a Zener diode (Dz1) can be used. Similarly on the  $V_{boot}$  pin, a Zener diode (Dz2) can be placed in parallel with each  $C_{boot}$ .
8. The use of the decoupling capacitor  $C_4$  (100 to 220 nF, with low ESR and low ESL) in parallel with the electrolytic capacitor  $C_{Vdc}$  prevents surge destruction. Both capacitors  $C_4$  and  $C_{Vdc}$  should be placed as close as possible to the IPM ( $C_4$  has priority over  $C_{Vdc}$ ).
9. By integrating an application-specific type HVIC inside the module, direct coupling to the MCU terminals without an optocoupler is possible.
10. Low inductance shunt resistors should be used for phase leg current sensing.
11. In order to avoid malfunctions, the wiring on N pins, the shunt resistor and PWR\_GND should be as short as possible.
12. The connection of the SGN\_GND to the PWR\_GND at one point only (close to the shunt resistor terminal) can reduce the impact of power ground fluctuation.

These guidelines ensure the device specifications for application designs. For further details, please refer to the relevant application note.

**Table 13. Recommended operating conditions**

| Symbol     | Parameter                          | Test conditions  | Min. | Typ. | Max. | Unit         |
|------------|------------------------------------|--|------|------|------|--------------|
| $V_{PN}$   | Supply voltage                     | Applied among P-Nu, $N_V$ , $N_W$  |      | 300  | 400  | V            |
