

Features

- Real time AEQ 4-channel Video/Audio decoder for WD1(960H) and D1 cameras
- Built-in Adaptive Equalizer(AEQ) for the best picture image in the several hundred meter coax cable condition
- Proprietary Pericom AEQ technology recover weak, noisy, or unstable analog input signals
- Resilient SYNC TIP detection to lock video signal in a noisy environment
- Programmable sharpness, CTI, hue, saturation, contrast and brightness
- Support time multiplexed format of ITU-R BT.656 output with 54/108MHz or 72/144MHz
- Provides a programmable mapping from four or eight (non-real-time) analog video inputs to four BT.656 digital outputs
- NTSC(M), NTSC 4.43, PAL (B, D, G, H, I, M, Nc, 60) standard support
- High performance 5H comb filter for all NTSC/PAL standards
- Built-in 10-bit audio Codec to allow 5 analog audio inputs and 1 audio output
- Mixed audio analog output for multiple audio channels
- Two serial audio formats (I2S and DSP) are supported for recording/mixing output and playback input
- Selectable Master and Slave serial audio interface
- Multiple audio sample rates for 8, 16, 32, 44.1, 48KHz audio frequency
- Integrated video PLL for 108MHz, 144MHz clock output
- Two-wire serial interface(I²C) for register access
- Provide system interrupt request for video
- Packages: 128-pin LQFP

Description

PI7VD9004ABH is AEQ 4-Channel Video Decoders and Audio Codec. Built-in Adaptive equalizer (AEQ) recover the noisy signals caused by long or small wire gauge Coax cables and display the best picture image view quality. The video decoder converts NTSC, PAL analog composite video broadcasting signal (CVBS) into digital components YCbCr for video controller or processor to perform pre-view, compression and storage etc. The converted digital video streams complying with ITU-R BT.656 are transported in time multiplexed format, which contains one, two or four video channels.

Single 27MHz reference crystal clock support NTSC, PAL and 960H standard resolution. Each video channel contains 10-bit ADC, proprietary clamp, automatic gain controller and 5H comb filter for separating luminance & chrominance to reduce artificial noise.

Application

- Video Security DVRs, PC-DVR, Video Capture cards
- Automotive Camera Driver Assistant Systems
- Video Broadcasting Equipment

3 Pin-out Information

Analog Video/Audio Interface

Pin Name	Pin Number	Type	Description
CV_INA0, CV_INB0, CV_INA1, CV_INB1, CV_INA2, CV_INB2, CV_INA3, CV_INB3	110, 111, 113, 114, 116, 117, 119, 120	Analog	CVBS input A of Video channel 0 CVBS input B of Video channel 0 CVBS input A of Video channel 1 CVBS input B of Video channel 1 CVBS input A of Video channel 2 CVBS input B of Video channel 2 CVBS input A of Video channel 3 CVBS input B of Video channel 3
VCM	102	Analog	Connect to an external capacitor
LINE_IN0, LINE_IN1, LINE_IN2, LINE_IN3, LINE_IN4	103, 104, 105, 106, 107	Analog	Line input of Audio channel 0 Line input of Audio channel 1 Line input of Audio channel 2 Line input of Audio channel 3 Line input of Audio channel 4
LINE_OUT	99	Analog	Mixed Analog Audio Output

Digital Video/Audio Interface

Pin Name	Pin Number	Type	Description
PIXOUT_0[7:0]	63, 64, 65, 66,68,69, 70,71	Output	Bt.656 Time Multiplex Division output of port 0
PIXOUT_1[7:0]	50, 51, 52, 53, 56,57,58,59	Output	Bt.656 Time Multiplex Division output of port 1
PIXOUT_2[7:0]	30, 31, 32, 33, 36, 37, 38, 39	Output	Bt.656 Time Multiplex Division output of port 2
PIXOUT_3[7:0]	16, 17, 18, 19, 22, 23, 24, 25	Output	Bt.656 Time Multiplex Division output of port 3
GPIO_0	83	Output	According to register setting, it outputs GPO, HSYC, VSYNC, FDFLAG, ACTIVE and VDLOSS of channel 0
GPIO_1	84	Output	According to register setting, it outputs GPO, HSYC, VSYNC, FDFLAG, ACTIVE and VDLOSS of channel 1
GPIO_2	85	Output	According to register setting, it outputs GPO, HSYC, VSYNC, FDFLAG, ACTIVE and VDLOSS of channel 2
GPIO_3	86	Output	According to register setting, it outputs GPO, HSYC, VSYNC, FDFLAG, ACTIVE and VDLOSS of channel 3
SCLK_R	73	Input/ Output	Record audio serial clock. It is an input pin under slave mode, while output pin under master mode.
LRCK_R	74	Input/ Output	Record audio serial sync pulse. It is an input pin under slave mode, while output pin under master mode.
SDOUT_R	75	Output	Record audio serial data output.
SDOUT_M	76	Output	Mixing audio serial data output.
SCLK_P	78	Input/ Output	Playback audio serial clock. It is an input pin under slave mode, while output pin under master mode

LRCK_P	79	Input/ Output	Playback audio serial sync pulse. It is an input pin under slave mode, while output pin under master mode.
SDIN_P	80	Input	Playback audio serial data input.
SD_LINKI	14	Input	Chip-to-Chip audio serial data input.
SD_LINKO	81	Output	Chip-to-Chip audio serial data output.

System Control Interface

Pin Name	Pin Number	Type	Description
RESET_L	10	Input	Chip Reset. Active Low.
XIN	46	Input	27MHz or 54MHz crystal input or 27MHz/54MHz/108MHz oscillator input
XOUT	47	Output	27MHz or 54MHz crystal output
PIXCLK_P0	42	Output	Positive Output clock signal running at 27/54/108MHz (720H mode) or 36/72/144MHz (960H mode) for bus PIXOUT_0.
PIXCLK_N0	43	Output	Negative Output clock signal running at 27/54/108MHz (720H mode) or 36/72/144MHz (960H mode) for bus PIXOUT_0
TM1	5	Input	Test pin. Tied to VSS.
SA1	7	Input	Device Address 1 of I2C slave interface
SA0	6	Input	Device Address 0 of I2C slave interface
SCL	11	Input	Input clock signal of I2C slave interface
SDA	12	Input/ Output	Data signal of I2C slave interface
INT	88	Output	Interrupt signal to system. Active High.

Power and Ground

Pin Name	Pin Number	Type	Description
VDDC	4, 9, 21, 27, 35, 45, 55, 62, 87	Power	1.0V Power for core logic
VD33	15, 29, 41, 49, 60, 72, 82	Power	3.3V Power for IO pads
VSS	1, 2, 3, 13, 20, 26, 28, 34, 40, 44, 48, 54, 61, 67, 77, 89, 90, 100, 101, 112, 118, 123, 125	Ground	Ground for video ADC, audio ADC, audio DAC, PLL, core logic and IO pads
ADC_VDD	108, 109, 115, 121, 122, 124, 126	Power	3.3V Power for video ADC and audio ADC.
ADAC_VDD	97, 98	Power	3.3V Power for audio DAC
VDDPLL	127, 128	Power	3.3V Power for AV PLL

No Connection Pins

Pin Name	Pin	Type	Description
NC	91, 92, 93, 94, 95, 96	N/A	Not Connected Pin. Please let these pins floating.

4 Functional Description

4.1 Video/Audio Analog Input

PI7VD9004ABH offers 4 channels NTSC, PAL (720H or 960H) format composite (CVBS) inputs (CV_INAx and CV_INBx, x= 0,1,2,3). When the input signal is weak and the color burst is not able to be recognized, the video is automatically switched to Black and White mode to enhance the picture image quality.

Format	Lines	Field	Fsc	Country
NTSC-M	525	60	3.579545 MHz	U.S., many others
NTSC-Japan	525	60	3.579545 MHz	Japan *
NTSC (4.43)	525	60	4.433619 MHz	Transcoding
PAL-B, G, N	625	50	4.433619 MHz	Many
PAL-I /H /D	625	50	4.433619 MHz	Belgium ,China Great Britain, others
PAL-M	525	60	3.575612 MHz	Brazil
PAL-CN	625	50	3.582056 MHz	Argentina
PAL-60	525	60	4.433619 MHz	China

* NTSC-Japan has 0 IRE setup

4.2 Clamping and Automatic Gain Control

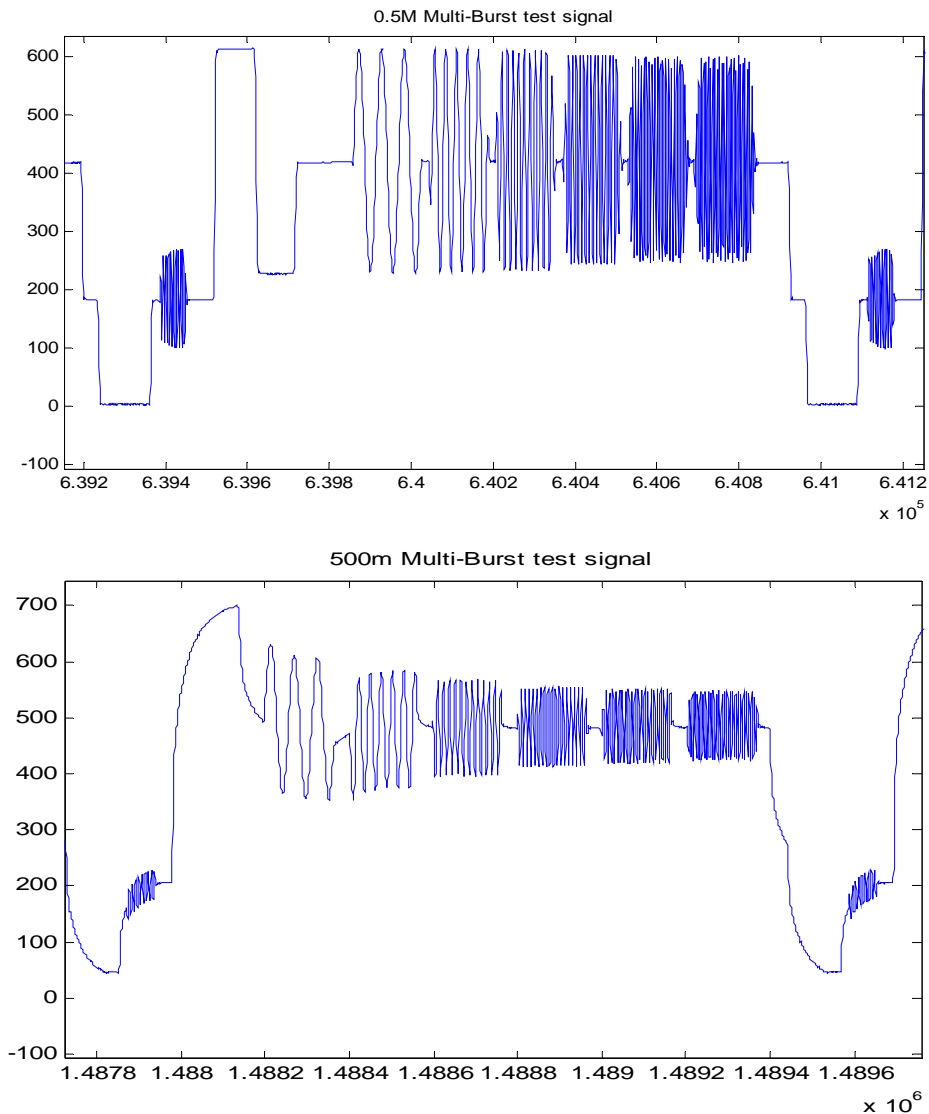

Each analog input channel has built-in clamping circuits to restore signal DC level. Automatic Gain Control (AGC) circuits in the internal video processor can compensate average input video signal level for each analog input channel. The AGC and clamping circuits prevent signal level saturation and allow the video decoder to deliver the best signal-to-noise performance. On the other hand, the AGC cooperates with the digital multiplier of video decoder to boost the weak signals. The circuits perform Automatic Gain Control through internal feedback loop. Manual gain control is also available through configuring the Video Decoder Control and Status Registers

4.3 Video Decoder

The video decoder in the chip converts NTSC and PAL video signals to 8-bit ITU-R BT.656 format. The chip includes four high speed and low power 10-bit analog-to-digital converters (ADC) with 2x sampling rate to support 4-channel video decoding. When the incoming video is in the 720H format, the sampling rate is 27MHz or 54MHz by 2x factor. For 960H format, the sampling rate is 36MHz or 72MHz by 2x factor. The chip implements proprietary circuit design that is optimized for locking in weak, noisy, or unstable signals. The minimal signal voltage that can be locked in is at 160/80 mV

4.4 Adaptive Equalization

The CVBS is suffered from channel loss by an extended transmission distance (greater than 500m) and a small diameter (less than 0.5mm) of CCTV cable. The distortion on CVBS after the energy reduction effect of cable length is illustrated as below. For example, a Multi-Burst test signal is respectively measured at 0.5m and 500m of cable. It appears that color burst and sync tip have severe degradation after 500m transmission distance. Adaptive equalization on the distorted CVBS recovers the signal back to close to the original level. Since the different cable conditions present various effects on CVBS picture image, the adaptive equalization provides to compensate the signal loss on some frequency components pertinent to the Coax cable.

4.5 Comb filter and Y/C Separation

The video decoder is capable of separating luma (Y) and chroma (C) of NTSC or PAL video signals using 5-line adaptive comb filter or notch/band-pass filter. The comb filter searches for correlation between 5 lines of input video stored in the internal buffer. The lines are averaged based on the degree of correlation to produce the output video line. If no correlation is found between the 5 lines of video, notch/band-pass filter is used. This process is very effective at reducing cross-luma and cross-chroma noise. The noise appears as artifacts that degrade the image quality. Reduction of the noise improves the image quality significantly.

4.6 Video Signal Processing

The chip is capable of processing digital video signal to fulfill better detection in a noisy environment and achieve good image quality for viewing as well. For video signal detection, a resilient SYNC TIP detection mechanism is implemented to locate VSYNC and HSYNC correctly in order to lock the video frame or video line.

In general, the poor power adaptor or camera would introduce high frequency ripples coupling with sync tip to cause the misjudgment on the beginning of a video frame or line. The built-in video processing circuit is able to decouple the noise from sync tip to prevent from video loss.

A sharpness filter is implemented to offer programmable 16 level gains to increase the high frequency and edge information of luma for better viewing on the contour of each object. Through the I2C serial interface, hue, contrast, brightness and saturation can be programmed in the configuration registers. Hue can be controlled in 256 steps from -180 degrees to +180 degrees. Saturation can be programmed in 256 grades. Brightness can be adjusted in 256 levels.

4.7 Video Output Port

The four CVBS analog video channels are converted into four individual digital video data streams. There are four video output ports (PIXOUT_0, PIXOUT_1, PIXOUT_2 and PIXOUT_3) in the chip and each video output port can carry several converted digital video data stream following ITU-R BT.656 compatible data format. The video data of each port is synchronous with the corresponding clock signals of PIXCLK_PO or PIXCLK_NO. The frequency of PIXCLK_*O can be operated at 1x, 2x or 4x of 27MHz (720H mode) or 36MHz (960H mode). When the clock frequency is 2x or 4x rate, the video port outputs 2-channel or 4-channel video data stream in time-multiplexed format. The clock phase of PIXCLK_PO or PIXCLK_NO can be programmed by delay cells through writing delay value into the registers of PIXCLK_P_DEL or PIXCLK_N_DEL. Also, the clock polarity can be controlled through inverter by setting or resetting the register of PIXCLK_P_POL or PIXCLK_N_POL. The flexibility on changing clock phase or polarity facilitates the timing design for video data stream on PCB.

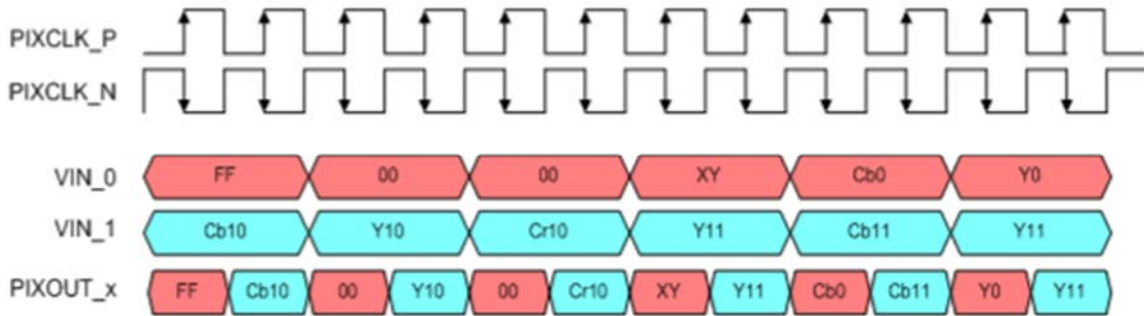

Figure 4-2 Time-multiplexed format with 54/72MHz

4.8 ANALOG AUDIO INPUT

The audio ADC offers 5 channels of analog inputs (LINE_IN_x, x= 0, 1, 2, 3, 4) with a peak-to-peak voltage range from 0.5V to 2V. Each input channel contains 4-bit programmable gain amplifier and an ADC with maximum over-sampling speed of 3.6M Sample/s. A pseudo differential input is used to minimize board level noise problems. The converted audio data stream is fed into a low pass filter to decimate audio sample at an appropriate audio sampling rate such as 8 KHz, 16 KHz, 32 KHz, 44.1 KHz and 48 KHz etc.

4.9 AUDIO PROCESSING

The audio processor accepts 5 digital audio streams from audio ADC. It also receives 2 additional digital serial audio data from pins. One digital serial audio data is SDIN_P coming from AV compression processor, while the other one is SD_LINKI coming from companion device.

SDIN_P represents the decompressed audio data for playback purpose. SD_LINKI is used to cascade with as many as 12 or 15 digital audio outputs from three other PI7VD9004ABH chips for forming one timing multiplexed I2S digital serial audio data containing 16 or 20 digital audio channels. This device processes these 5 digital audio streams and 2 digital serial audio data, then generates one mixing analog audio signal and three digital serial audio data to fulfill the functions of mixing, recording and cascading etc.

For audio mixing, this device has both analog and digital format. The built-in mixer selects among all audio input data to generate the mixing digital audio data (SDOUT_M), which connects to audio DAC for converting to mixing analog audio signal output (LINE_OUT).

For audio recording, the audio processor performs multiplexing over 12 or 15 digital audio streams in timing division way to generate record digital audio output data (SDOUT_R). For the digital serial audio data SDOUT_R and SDOUT_M, they are both synchronized with SCLK_R and LRCK_R. As to SDIN_P, it is synchronized with SCLK_P and LRCK_P. These digital serial audio data support two formats of I2S and DSP that can be selected by control bits RM_SYNC in the register at offset 0xD2 and PB_SYNC in the register at offset 0xDB. Meanwhile, the record and playback digital serial audio interfaces of PI7VD9004A(A/B/C)H can be acted as Master or Slave mode based upon the setting of ACLKRMASER and PB_MASTER bits in the register at offset 0xDB

This device supports audio system clock with 256fs or 320fs mode, which is controlled by AIN5MD register. The record output pin contains several channel inputs that can be defined by the registers at offset of 0xD2~ 0xDA describing the number and sequence of recorded audio streams. It supports 8bit and 16bit record data width for trading off between higher audio qualities and saving disk storage space. By controlling bit2 of register at offset 0xDB, the chip allows to select the output record data width to be either 8-bit or 16-bit mode.

I2S mode

DSP mode

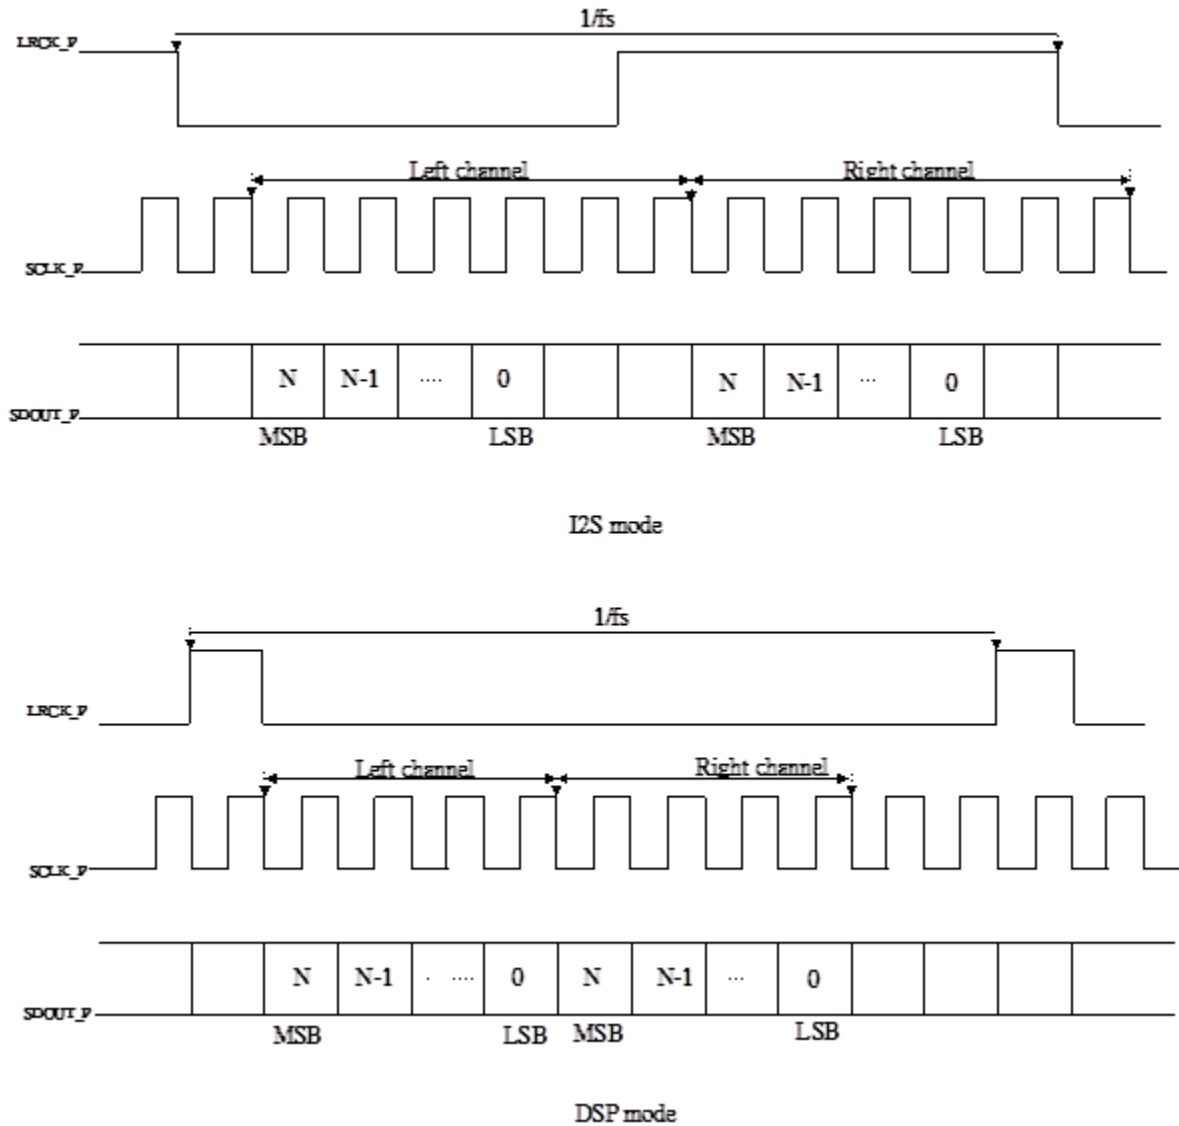

Figure 4-4 Playback input format

4.10 PI7VD9004ABH Cascade Mode

For audio cascading, the chip redirects SDOUT_R as SD_LINKO to connect with SD_LINKI of another PI7VD9004AB product, which cascades its original SDOUT_R and SD_LINKI to create a new SDOUT_R. PI7VD9004AB can support 16 channel data output on first level chip record output pin for saving pin layout on PCB board. The cascade chips have to use same crystal clock source and same reset signal.

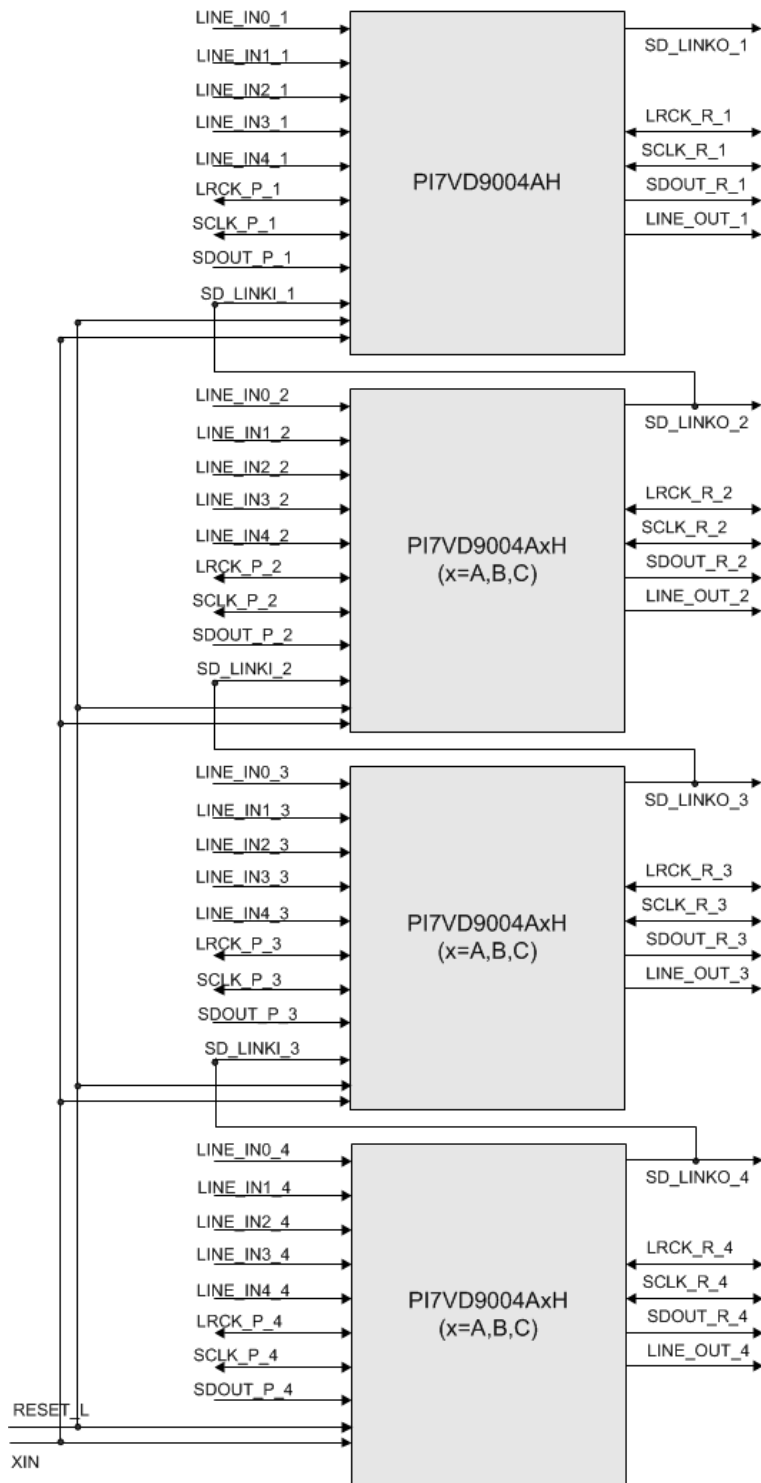

Figure 4-5 Audio Cascading Example

4.11 I²C Host Interface

The processor can access the internal register by executing read or write command to the indexed locations to implement the function of detecting audio and video signal and reveals the detection status through the configuration registers. If any audio or video channel is present or absent, interrupt pin (INT) can notify the status to the processor to manage CPU resource effectively by polling the status. The chip supports flexibilities to select various detection modes and enable individual audio/video channel for generating interrupt.

These control bits to interrupt pin are defined in the registers of AVDET_MODE, AVDET1_ENA, AVDET2_ENA, A51DET_ENA and A52DET_ENA.

6 Control Register

6.1 REGISTERS

Register Type	Descriptions
R	Read Only
RW	Read/Write

6.1.1 VIDEO STATUS REGISTER – OFFSET 00H/10H/20H/30H (Default: 00H)

BIT	FUNCTION	TYPE	DESCRIPTION
-----	----------	------	-------------

BIT	FUNCTION	TYPE	DESCRIPTION
0	DET50	R	0: 60Hz source detected 1: 50Hz source detected
1	MONO	R	0:Color burst signal detected 1: No color burst signal detected
2	Reserved	R	Reset to 0b
3	VLOCK	R	0: Vertical logic is not locked 1: Vertical logic is locked to incoming video
4	Reserved	R	Reset to 0b
5	SLOCK	R	0: Sub-carrier sync is not detected 1: Sub-carrier sync is detected
6	HLOCK	R	0:Horizontal sync is not detected 1: Horizontal sync is detected
7	VDLOSS	R	0: Video is detected 1: Video not present

6.1.2 BRIGHTNESS CONTROL REGISTER – OFFSET 01H/11H/21H/31H(Default=00H)

BIT	FUNCTION	TYPE	DESCRIPTION
[7:0]	Brightness	RW	These Signed bits control the brightness.Value range from -128 to 127 8'h7F: brightest; 8'h80: darkest ;8'h00 : no effect

6.1.3 CONTRASTCONTROL REGISTER – OFFSET 02H/12H/22H/32H(Default=64H)

BIT	FUNCTION	TYPE	DESCRIPTION
[7:0]	Contrast	RW	These unsigned bits control the luminance gain. 8'h7F: maximum contrast 8'h00: minimum contrast

6.1.4 SHARPNESS CONTROL REGISTER – OFFSET 03H/13H/23H/33H(Default=00H)

BIT	FUNCTION	TYPE	DESCRIPTION
[3:0]	Sharpness	RW	These bits control the amount of sharpness enhancement on the luminance signals "0" has no effect on the output image "1" through "15" provides sharpness enhancement with "15" being the strongest
[7:4]	Reserved	R	Reset to 0h

6.1.5 CHROMA(U) GAIN REGISTER – OFFSET 04H/14H/24H/34H(Default=80H)

BIT	FUNCTION	TYPE	DESCRIPTION
[7:0]	Chroma (U) Gain	RW	Chroma gain value of controlling the color saturation

6.1.6 CHROMA(V) GAIN REGISTER – OFFSET 05H/15H/25H/35H(Default=80H)

BIT	FUNCTION	TYPE	DESCRIPTION
[7:0]	Chroma (V) Gain	RW	Chroma gain value of controlling the color saturation

6.1.7 HUECONTROL REGISTER – OFFSET 06H/16H/26H/36H(Default=00H)

BIT	FUNCTION	TYPE	DESCRIPTION
[7:0]	Hue	RW	These signed bits control color hue. +90C(7Fh) to -90C(80h)

7 Electrical Characteristics

7.1 Absolute Maximum Ratings

(Above which useful life may be impaired. For user guidelines, not tested.)

Parameters		Value	Note: Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
Supply Voltage Range	3.3V Power Supply	-0.3V to 4.5V	
	Core Power 1.0V Supply	-0.3V to 1.8V	
T _A Operating free-air temperature range		-45 °C to 85 °C	
T _{stg} Storage Temperature		-65 °C to 150 °C	

7.2 Operating Conditions

Symbol	Parameters	Min.	Typ.	Max.	Unit
VD33,ADC_VDD, ADAC_VDD, VDDPLL	3.3V Power supply voltage	3.0	3.3	3.6	V
VDDC	Core Power supply voltage	0.9	1.0	1.1	V
V _{I(P-P)}	Analog input voltage (ac-coupling necessary)	0		1.6	V
T _A	Ambient free-air temperature	0		70	°C

7.3 DC Electrical Characteristics

Symbol	Parameters	Conditions	Min.	Typ.	Max.	Unit
V _{IH}	Digital input high voltage		2.0		3.6	V
V _{IL}	Digital input low voltage		-0.3		0.8	V
V _{OH}	Digital Output high voltage		2.4			V

V_{OL}	Digital Output low voltage				0.4	V
I_L	Input Leakage Current				+/- 1	μ A
I_{OZ}	Tri-state output leakage current				+/- 1	μ A
I_{OH}	High level output current	$V_{OH}=2.4V$	11	17	24	mA
I_{OL}	Low level output current	$V_{OL}=0.4V$	8	13	16	mA
R_{pu}	Input pull-up resistance	$V_{in}=0$	61	75	105	K Ω
R_{pd}	Input pull-down resistance	$V_{in}=DVDD33$	101	199	330	K Ω
T_j	Junction temperature		-40	25	125	$^{\circ}$ C

7.3.1 Power Dissipation

Symbol	Parameters	Test Condition	Min.	Typ.	Max.	Unit
$3.3V_{TOTAL}$	Total 3.3V Power Voltage	Connect all Video/Audio PINS		218		mA
$1.0V_{TOTAL}$	Core Supply Voltage (VDDC)	Connect all Video/Audio PINS		158		mA
P_{TOT}	Total Power Consumption	Connect all Video/Audio PINS		741		mW

7.3.2 Power-On Sequence of 3.3V and 1.0V Power

Symbol	Parameters	Min	Typ	Max	Unit
T1	Interval Delay between IO and Core Power Supply	0	10	500	ms

7.3.3 Crystal Specifications

Parameters	Min	Typ	Max	Unit
Frequency		27		MHz
Frequency tolerance		\pm 50		ppm

7.4 AC Electrical Characteristics

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
Z_i	Input impedance	Analog video inputs by design		40		k Ω
C_i	Input Capacitance	Analog video inputs by design		10		pF
DNL	Differential Non Linearity				\pm 2	LSB
INL	Integral Non Linearity				\pm 3	LSB
V_i	Full scale input range	The expected full input range is only 0.5 Vpp to 1.0 Vpp.	0.25		1.6	Vpp
SNR	Signal to Noise Ratio	This is measured with a -1dB full scale input signal and adjusted for full scale amplitude	50			dB
THD	Total Harmonic Distortion			-50		dB
	Analog input bandwidth	This bandwidth does not include		300		MHz

		limitations due to the source impedance of 37.5 and loading on the board, 30 pF (140 MHz).				
--	--	--	--	--	--	--

7.4.1 Audio Electrical Characteristics

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
Zi	Input impedance	Analog video inputs by design		40		kΩ
Ci	Input Capacitance	Analog video inputs by design		10		pF
Vi	Maximum Input Range		0.25		1.6	V
SNR	Signal to Noise Ratio			85		dB
DNR	Dynamic Range			80		dB
THD	Total Harmonic Distortion			-75		dB

7.4.2 Pixel Clock and Video Data Timing

Symbol	Parameter	Min	Typ	Max	Unit
TS1	Setup from PIXCLK_PO to PIXOUT (144MHz)	2.6	-	4.3	ns
TH1	Hold from PIXCLK_PO to PIXOUT (144MHz)	2.7	-	4.4	ns
TS2	Setup from PIXCLK_PO to PIXOUT (108MHz)	3.8	-	5.4	ns
TH2	Hold from PIXCLK_PO to PIXOUT (108MHz)	3.9	-	5.5	ns
TS3	Setup from PIXCLK_PO to PIXOUT (72MHz)	5.6	-	7.6	ns
TH3	Hold from PIXCLK_PO to PIXOUT (72MHz)	6.3	-	8.3	ns
TS4	Setup from PIXCLK_PO to PIXOUT (54MHz)	8.2	-	10.3	ns
TH4	Hold from PIXCLK_PO to PIXOUT (54MHz)	8.3	-	10.4	ns
TS5	Setup from PIXCLK_PO to PIXOUT (36MHz)	14.1	-	16.1	ns
TH5	Hold from PIXCLK_PO to PIXOUT (36MHz)	11.7	-	13.7	ns
TS6	Setup from PIXCLK_PO to PIXOUT (27MHz)	19	-	20.9	ns
TH6	Hold from PIXCLK_PO to PIXOUT (27MHz)	16.1		18	ns

The timing value is measured by the following conditions: (1) the clock delay control on PIXCLK_PO pin is set to zero; (2) the clock polarity control on PIXCLK_PO pin is not inverted.

Figure 7-1 OTDM is operated at 144MHz

Figure 7-2 OTDM is operated at 108MHz

Figure 7-3 OTBM at 72/36MHz

Figure 7-4 OTBM at 54/27MHz

7.4.3 Audio Interface Timing

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
$T_{S_LRCK_R}$	Setup Time for LRCK_R	Slave Mode	0.2	-		ns
$T_{H_LRCK_R}$	Hold Time for LRCK_R		0.4	-		ns
T_{S_PB}	Setup Time for LRCK_P and SDIN_P		0.1	-		ns
T_{H_PB}	Hold Time for LRCK_P and SDIN_P		0.55	-		ns
T_{RM_PD}	Propagation Delay for SDOUT_R/M, LRCK_R	Master Mode	2.6	-	5.9	ns
T_{PB_PD}	Propagation Delay for LRCK_P		2.2	-	4.8	ns

Figure 7-5 Digital Serial Audio Interface Slave Mode Timing Diagram

Figure 7-6 Digital Serial Audio Interface Master Mode Timing Diagram

7.4.5 I2C Host Port Timing

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
t1	Bus free time between STOP and START		1.3			μs
t2	Setup time, (repeated) START condition		0.6			μs
t3	Hold time, (repeated) START condition		0.6			μs
t4	Setup time, STOP condition		0.6			ns
t5	Data setup time		100			ns
t6	Data hold time		0		0.9	μs
t7	Rise time, VC1(SDA) and VC0(SCL) signal	Specified by design			250	ns
t8	Fall time, VC1(SDA) and VC0(SCL) signal	Specified by design			250	ns
C _b	Capacitive load for each bus line	Specified by design			400	pF
f _{i2c}	I ² C clock frequency				400	kHz

8 Packaging Mechanical

07-0353

 Note: For latest package info, please check: <http://www.pericom.com/products/packaging/mechanicals.php>

9 Ordering Information

Ordering Code	Package Code	Package Description
PI7VD9004ABHFD	FD128(No EPAD)	128-LQFP, Pb-free & Green

Notes:

1. Thermal characteristics can be found on the company web site at www.pericom.com/packaging/
2. Adding "E" = Pb-free, "I"=Industrial, "FP"=Package code, "X" suffix = Tape/Reel

10 Related Product Information

Part Number	Product Description
PI7VD9008H	8-channel 960H Video Decoder with 10-bit Audio ADC
PI7VD9004H	4-channel 960H Video Decoder with 10-bit Audio ASC
PI7C9X9208	8-channel D1 PCIe Video Decoder with 16-bit Audio ADC
PI7C9X9204S	4-channel D1 PCIe Video Decoder with 16-bit Audio ADC
PI7VD9008HEVB	PI7VD9008 Evaluation Kit
PI7VD9208HEVB	PI7VD9208 Evaluation Kit
