With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation, warranties of non-infringement of intellectual property rights of any third party.

### **Information**

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office ([www.infineon.com](http://www.infineon.com)).

### **Warnings**

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.

Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

## 1 Product Description

### 1.1 Overview

The TLV4976-2K is a high precision unipolar Hall switch with a two wire, 6mA/14mA current interface in a SMD package. A chopped measurement principle provides high stability switching thresholds for operating temperatures between -40°C and 85°C.

### 1.2 Features

- 3.0V to 18V supply voltage operation
- High sensitivity and high stability of the magnetic switching points
- High resistance to mechanical stress by Active Error Compensation
- Reverse battery protection (-18V)
- Superior temperature stability
- Low jitter (typ. 1µs)
- High ESD performance (± 4kV HBM)
- Digital output signal with current modulation 6 / 14mA
- Unipolar version
- SMD package SC59 (SOT23 compatible), lead free and halogen free
- For industrial and consumer applications, not qualified for automotive applications

### 1.3 Target Applications

The sensor targets all applications where a high precision unipolar magnetic switch is required (e.g. position sensing). Due to the current interface the number of wires required in the application is minimized thus saving costs and increasing reliability. This is specially helpful in all applications where the microcontroller is not on the same PCB as the Hall switch but in some distance.

TLV4976-2K	Hall Effect Switch	SP000803734	PG-SC59-3-5

## 2 Functional Description

### 2.1 General

The TLV4976-2K is an integrated circuit Hall-effect sensor designed specifically for highly accurate applications. Precise magnetic switching thresholds and high temperature stability are achieved by active error compensation circuits and chopper techniques on the chip. The IC has a current interface with a 6mA / 14mA output. A magnetic south pole (positive field) with strength above  $B_{rp}$  turns the output to low (6mA) and a magnetic field with strength below  $B_{op}$  turns it to high (14mA).

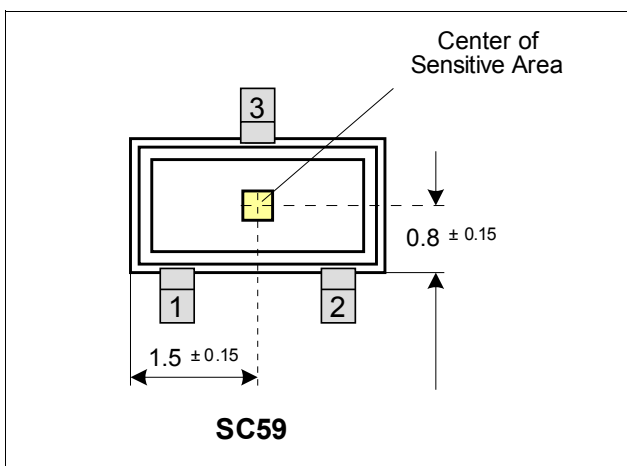

Figure 1 Pin Configuration and Center of Sensitive Area

### 2.3 Pin Description

Table 1 Pin Description

Pin No.	Symbol	Function	Comment
1	$V_S$	Supply voltage	
2	N.C.	No internal connection	
3	GND	Ground	

## 2.4 Block Diagram

Figure 2 Functional Block Diagram

## 2.5 Functional Block Description

The chopped Hall IC Switch comprises a Hall probe, bias generator, compensation circuits, oscillator and output transistor.

The bias generator provides currents for the Hall probe and the active circuits. Compensation circuits stabilize the temperature behavior and reduce technology variations.

The Active Error Compensation rejects offsets in signal stages and the influence of mechanical stress to the Hall probe caused by molding and soldering processes and other thermal stresses in the package.

This chopper technique together with the threshold generator and the comparator ensure high accurate magnetic switching points.

The current consumption depends on the switching status.

Figure 4 Output Signal

### 3 Specification

#### 3.1 Application Circuit

The advantage of the current interface is, that only two wires are necessary to connect the sensor.

At least one series resistor is required to convert the two output states of the Hall sensor from current consumption to a voltage information.

A typical value for  $R_L$  is  $100\Omega$ . This gives a typical signal voltage level  $V_{SIG} = 0.8V$  in the *Off* state and  $1.4V$  in the *On* state.

If the sensor is operated in an application environment with disturbances on the supply line, an additional series resistor  $R_S$  is recommended. The maximum value for the series resistor  $R_S$  can be calculated using the following formula:

$$R_{Smax} = \frac{V_{Supplymin} - V_{Smin}}{I_{Shighmax}} - R_L$$

$V_{S\_min}$  is the minimal supply voltage which might occur due to disturbances on the supply line  $V_S$ .

Example:  $V_{Supplymin} = 6V$ ;  $V_{Smin} = 3V$ ;  $R_L = 100\Omega$ ;  $I_{Shighmax} = 17mA$  :  $R_{Smax} = 76.5\Omega$

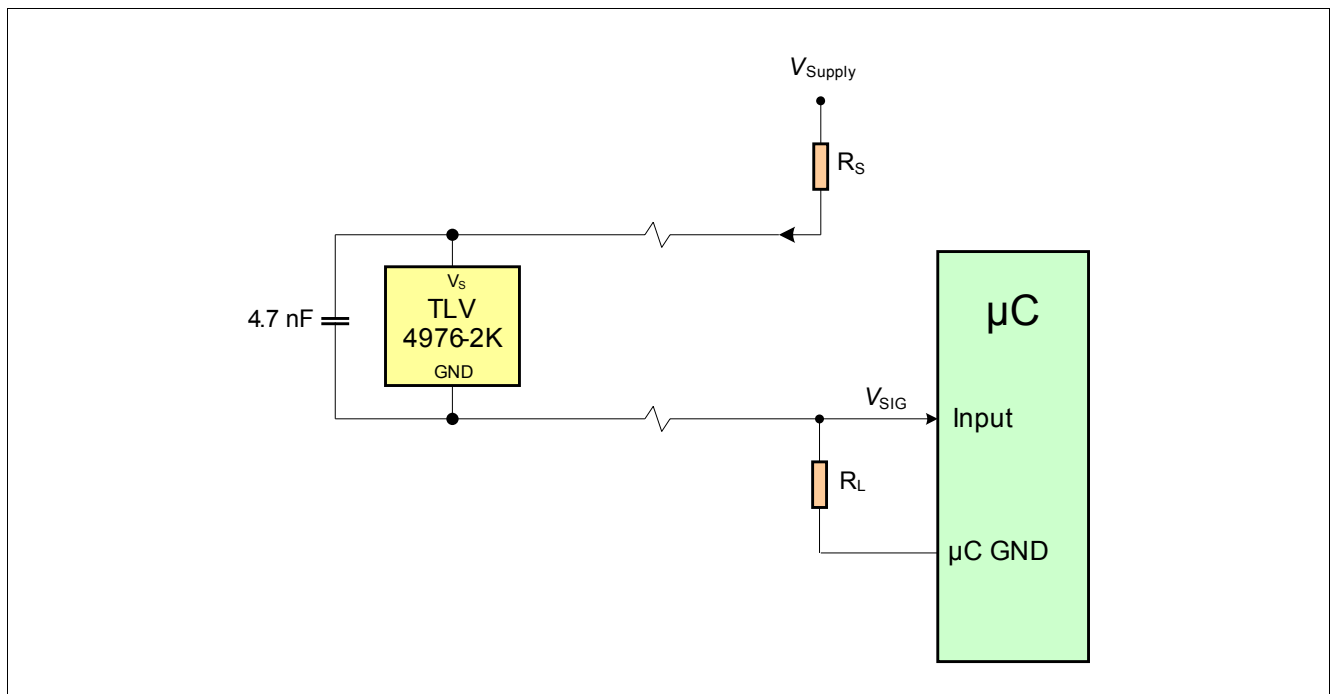

Figure 5 Application Circuit

### 3.2 Absolute Maximum Ratings

**Table 2 Absolute Maximum Rating Parameters**

Parameter	Symbol	Limit Values		Unit	Note / Test Condition
		Min.	Max.		
Maximum Ambient Temperature	$T_A$	-40	125	°C	
Maximum Junction Temperature	$T_J$	-40	150	°C	
Supply Voltage	$V_S$	-18	18	V	
Supply current through protection device	$I_S$	-50	+50	mA	
Storage temperature	$T_S$	-40	150	°C	
Magnetic flux density	B	–	unlimited	mT	
ESD robustness HBM <sup>1)</sup>	$V_{ESD,HBM}$		4	kV	R = 1.5kΩ, C = 100pF $T_A = 25^\circ\text{C}$

1) Human Body Model (HBM) tests according to: EOS/ESD Association Standard S5.1-1993 and Mil. Std. 883D method 3015.7

**Attention: Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.**

### 3.3 Operating Range

The following operating conditions must not be exceeded in order to ensure correct operation of the Hall Effect Switch.

All parameters specified in the following sections refer to these operating conditions unless otherwise mentioned.

**Table 3 Operating Conditions Parameters**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Supply voltage	$V_S$	3		18	V	
Junction temperature	$T_j$	- 40		85	°C	

### 3.4 Electrical and Magnetic Characteristics

Product characteristics involve the spread of values guaranteed within the specified voltage and ambient temperature range. Typical characteristics are the median of the production.

**Table 4 General Electrical Characteristics<sup>1)</sup>**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Supply current low	$I_{SLOW}$	5	6	7	mA	$B > B_{RP}$ $V_S = 3V \dots 18V$
Supply current high	$I_{SHIGH}$	12	14	17	mA	$B < B_{OP}$ $V_S = 3V \dots 18V$

**Table 4 General Electrical Characteristics<sup>1)</sup> (cont'd)**

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Reverse current	$I_{SR}$		–	0.2	mA	$V_S = -18V$
Output fall time	$t_f$	–	0.4	1.6	$\mu s$	$R_S = 100\Omega$
Output rise time	$t_r$	–	0.4	1.6	$\mu s$	
Chopper frequency	$f_{OSC}$	–	320		kHz	
Switching freq.	$f_{SW}$		–	15 <sup>2)</sup>	kHz	
Delay time <sup>3)</sup>	$t_d$	–	13		$\mu s$	
Output jitter <sup>4)</sup>	$t_{QJ}$	–	1	–	$\mu s_{RMS}$	Typical value for square wave signal 1kHz
Power-on time <sup>5)</sup>	$t_{PON}$	–	13	–	$\mu s$	$V_S \geq 3.0V$
Thermal resistance <sup>6)</sup>	$R_{thJA}$	–	100	–	K/W	PG-SC59-3-5

1) over operating range, unless otherwise specified. Typical values correspond to  $V_S = 12V$  and  $T_A = 25^\circ C$

2) To operate the sensor at the max. switching frequency, the value of the magnetic signal amplitude must be 1.4 times higher than for static fields. This is due to the -3dB corner frequency of the low pass filter in the signal path

3) Systematic delay between magnetic threshold reached and output switching

4) Jitter is the unpredictable deviation of the output switching delay

5) Time from applying  $V_S \geq 3.0V$  to the sensor until the output state is valid

6) Thermal resistance from junction to ambient

**Calculation of the ambient temperature:**

e.g. for  $V_S = 12.0V$ ,  $R_S = 100W$ ,  $I_{SHIGHtyp} = 14mA$  :

Power Dissipation:  $P_{DIS} = 148.4mW$ .

In  $T_A = T_j - (R_{thJA} \times P_{DIS}) = 175^\circ C - (100K/W \times 0.15W)$

Resulting max. ambient temperature:  $T_A = 160^\circ C$

**Table 5 Magnetic Characteristics<sup>1)</sup>**

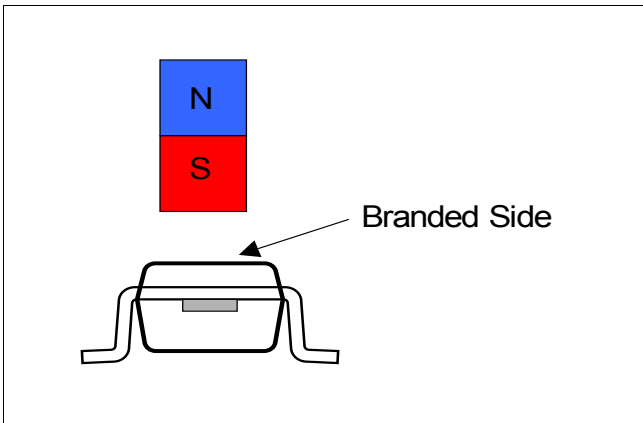

Parameter	Symbol	T (°C)	Values			Unit	Note / Test Condition
			Min.	Typ.	Max.		
Operating point	$B_{OP}$	-40	0.53	2.9	5.1	mT	
		25	0.5	2.7	4.8		
		85	0.47	2.5	4.5		
Release point	$B_{RP}$	-40	2.1	4.8	6.4	mT	
		25	2.0	4.5	6.0		
		85	1.9	4.2	5.6		
Hysteresis	$B_{HYS}$		0.5	1.8	3.0	mT	for T = 25°C
Temperature compensation of magnetic thresholds	$T_C$		-	-1000	-	ppm/K	
Repeatability of magnetic thresholds <sup>2)</sup>	$B_{REP}$		-	40	-	$\mu T_{RMS}$	Typ. value for $\Delta B / \Delta t > 12 mT/ms$

1) over operating range, unless otherwise specified. Typical values correspond to  $V_S = 12 V$ .

2) BREP is equivalent to the noise constant

**Field Direction Definition**

Positive magnetic fields are defined with the south pole of the magnet to the branded side of package.
